THE **MOBILE MAN PLATFORM LIFT** IS A HIGHLY VERSATILE MOBILE MACHINE DESIGNED TO MOVE PEOPLE TO AN ELEVATED POSITION FOR TEMPORARY WORK AT HEIGHT IN AREAS THAT ARE DIFFICULT TO ACCESS.

IT CONSISTS OF A MINIMUM OF A WORKING PLATFORM WITH SERVICE COMPONENTS, AN EXTENDIBLE STRUCTURE AND A CHASSIS. IT CAN BE SCISSOR, ARTICULATED BOOM, TELESCOPIC SECTION AND MIXED.

When ascending or descending the platform, check that there are no obstacles in its path and if you have to work on a site with pavements, place both wheels of the platform on the road **and do not step on manhole covers.**

When working on the platform, **ensure no work is being carried out simultaneously beneath or in the immediate vicinity of the platform.** This avoids the risk of objects falling on people.

Use a fall arrest harness attached to a **fixed part of the platform. Never attach yourself to external structural elements.** In this way, you avoid possible snagging and entrapment.

If the machine has a 220 V socket on the platform, connect the extension cable to a mains socket protected by a **30 mA differential**. In this way, you will avoid an electrical risk.

Keep the working platform clean of grease, mud, etc. **Distribute the load evenly** so it does not obstruct the working area. This avoids the risk of slipping and tripping.

The lifting platform **must be operated by at least two workers, one on the ground and one in the basket.** In this way, the worker on the ground can take over the controls in the event of an accident or breakdown, direct the driver if necessary and avoid the movement of machines and pedestrians around the machine.

When you have finished work, leave the platform out of service, **park the machine conveniently, remove the keys from the ignition and deposit them in the place provided for this purpose.** In this way, you prevent it from being used by anyone else.
